Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

## Description

### TECHNICAL FIELD

[0001] The present invention relates to a gas radiation oven range and particularly, to a gas radiation oven range, capable of discharging combustion gas and convection heat which is generated when mixed gas is burned in a gas radiation oven range having two or more radiant burners and improving productivity. A gas radiation oven range is known from DE-C-195 45 842.

### BACKGROUND ART

[0002] Generally, a gas radiation oven range is a device for cooking food by using radiation heat which is radiated from a heated radiator by heating the radiator.

[0003] Figure 1 is a view showing an embodiment of a conventional gas radiation oven range and Figure 2 is a partial longitudinal sectional view showing a structure of the conventional gas radiation oven range. As shown in the drawings, the gas radiation oven range comprising an outer case 10 which is formed to have an internal space with the upper side opened, ceramic glass 20 which is covered and combined with the upper end of the outer case 10, for placing foodstuffs therein, a burner housing 30 which is combined and contacted with the lower surface of the ceramic glass 20, for forming an exhaust passage F with the lower substrate of the ceramic glass 20 in a predetermined shape, and a radiant burner 40 which is combined with a side surface of the burner housing 30, for generating a radiant wave combusting mixed gas.

[0004] The outer case 10 is formed in a hexahedral shape with the upper side opened, an air inlet duct 11 is formed on the front surface of the case, and an exhaust duct 12 is formed on the rear surface of the hexahedron.

[0005] The ceramic glass 20 is formed to have an area and thickness which can cover the upper end of the outer case 10 and formed with materials through which radiant wave which is generated in the radiant burner 40 can penetrate.

[0006] On the upper side surface of the ceramic glass 20, a cooking area A is printed so that foodstuffs can be positioned at a position where radiant wave which is radiated from the radiant burner 40 is penetrated.

[0007] The burner housing 30 comprising a lower plate portion 31 which is formed to have a predetermined width and length, a side plate portion 32 which is respectively formed being bent and extended in the vertical direction on the both side surfaces of the lower plate portion 31, a connecting plate portion 33 which is formed being extended and bent to connect the both side plate portions 32 to a side end of the lower plate portion 31, a combining plate portion 34 which formed being extended and bent in the parallel direction from the ends of the both side plate portion 32 and connecting plate portion 33 respectively, having a predetermined area, and a mounting hole

35 which is penetrated and formed so that the radiant burner 40 can be mounted on a side surface of the lower plate portion 31 to be positioned at the side of the air inlet duct 11 of the outer case 10.

[0008] The connecting plate portion 33 of the burner housing 30 is positioned on the front surface of the outer case 10 and the opened part at the opposite side is positioned at the rear surface of the outer case 10.

[0009] The combining plate portion 34 is contacted and combined with the lower surface of the ceramic glass 20, and accordingly, the combining plate surface 34 forms an exhaust passage F for exhausting combustion gas and convection heat with the lower plate portion 31 and both side plate portions 32 of the burner housing 30, and the lower surface of the ceramic glass 20.

[0010] In the radiant burner 40, a burner head 41 where a mixing room M is formed, is fixed and combined to be positioned in the mounting hole 35 of the burner housing 30, and a mixing gas tube 44 is combined to a surface of the burner head 41. In addition, a burner mat 42 which is a radiator for radiating a radiant wave is fixed and combined to the upper side of the burner head 41 so that the burner mat 42 can cover the mixing room M of the burner head 41 by heating the mixed gas as the gas in the mixing room M is discharged and combusted.

[0011] A ignition and inflammation detecting unit 43 for igniting the mixed gas which is outflowed through the burner mat 42 and detecting the combusting state of the gas, is combined to the lower plate portion 31 of the burner housing 30 near from the burner mat 42.

[0012] A fan housing 45 in which a blast fan 46 and fan motor 47 are mounted, is combined to be connected with the mixing gas tube 44.

[0013] On the other hand, the radiant burner can be composed of a plurality of assemblies formed by combining the burner housing 30 and radiant burner 40, according to the usage and size.

[0014] Hereinafter, the operation of the above gas radiation oven range will be described as follows.

[0015] Firstly, when a gas radiation oven range is operated by putting a cooking vessel 50 in which foodstuffs are positioned in the cooking region of the ceramic glass 20, external air is sucked through the inlet duct 11 by rotation of the blast fan 46. The air is flowed into the mixed gas tube 44 and simultaneously, gas which is additionally supplied is supplied to the mixed gas tube 44 to be mixed with the air and the gas mixed with the air is outflowed through the burner mat 42 and combusted by being ignited by the ignition flame which is generated in the ignition and inflammation detecting unit 43.

[0016] At this time, as the mixed gas is outflowed through the burner mat 42 and combusted, the burner mat 42 is heated and a radiant wave is radiated from the burner mat 42. The radiant wave which is radiated from the burner mat 42 penetrates the ceramic glass 20, thus to cook the foodstuffs which are contained in the cooking vessel 50 by heating the vessel.

[0017] The combustion gas and convection heat which

are generated as the mixed gas is combusted, flow along the exhaust passage F which is formed by the ceramic glass 20 and burner housing 30 at a predetermined flow-rate and discharged to the outside of the gas radiation oven range through the exhaust duct 12 which is formed on the rear surface of the outer case 10.

[0018] On the other hand, the above conventional gas radiation oven range uses two burners and accordingly, a structure of respective component parts will be disclosed.

[0019] However, independent exhaust of respective burner housings under the condition that the size of the burners is different, makes controlling of the amount of exhaust difficult, and there can be occurred losses of cost and time as many components parts are assembled in manufacturing the burner.

[0020] Also, in families or professional places such as a hotel where the gas radiation oven range is used, burners with various heating power are needed according to the foodstuffs and simultaneously, occasions that various materials are cooked at the same time are often occurred. Therefore, small numbers of ports could not satisfy the above requirements.

[0021] Also, increase of the productivity in manufacturing the product is very important for manufacturing the gas radiation oven range as well as all industrial products. The conventional composition containing many component parts could not improve the productivity.

[0022] That is, the conventional gas radiation oven range having just two ports and respectively independent exhausting structure could not satisfy requirements of the present industries.

### **DISCLOSURE OF THE INVENTION**

[0023] Therefore, it is an object of the present invention to provide a gas radiation oven range which can discharge combustion gas and convection heat which is generated as mixed gas is combusted in a gas radiation oven range which includes two or more radiant burners efficiently, and improve productivity.

[0024] Also, it is an object of the present invention to provide a gas radiation oven range which can satisfy requirements of the present industries that need a plurality of ports for various cooking.

[0025] To achieve these objects, there is provided a gas radiation oven range comprising the features of claim 1. Dependent claims 2-27 relate to preferred embodiments of such a gas radiation oven range.

### **BRIEF DESCRIPTION OF THE DRAWINGS**

[0026]

Figure 1 is a perspective view showing an embodiment of a conventional gas radiation oven range;  
Figure 2 is a partial longitudinal sectional view showing a structure of the conventional gas radiation oven

range;

Figure 7 is a plan view showing a second embodiment of structure of the gas radiation oven range and the cooking system in accordance with the present invention; and

Figure 8 is a plan view showing a third embodiment of structure of the gas radiation oven range and the cooking system in accordance with the present invention.

### **MODES FOR CARRYING OUT THE PREFERRED EMBODIMENTS**

[0027] Hereinafter, the gas radiation oven range in accordance with the present invention will be described in detail with reference to the accompanied drawings.

[0028] Figure 3 is a perspective view showing a first embodiment of a structure of a gas radiation oven range and the cooking system in accordance with the present invention, Figure 4 is an exploded perspective view showing a structure of the gas radiation oven range in accordance with the present invention, and Figure 5 is a partial longitudinal sectional view showing a structure of the gas radiation oven range in accordance with the present invention.

[0029] Hereinafter, the gas radiation oven range in accordance with the present invention will be described.

[0030] First, as shown in Figures 3, 4 and 5, the structure of the gas radiation oven range in accordance with the present invention includes an outer case 10 which is formed to have an internal space with the upper side opened, ceramic glass 20 which covers and is combined with the upper end of the outer case 10, for placing foodstuffs thereon, a first burner housing 300 which is combined and contacted with the lower surface of the ceramic glass 20, for forming an exhaust passage F with the lower surface of the ceramic glass 20 in a predetermined shape, a radiant burner 40 which is combined with a side surface of the first burner housing 300, for generating a radiant wave combusting mixed gas, and a shared discharge unit 360 which is positioned at the lower portion of the plurality of first burner housings 300, combined to be connected to the respective exhaust passage F and extended so that the exhaust gas, which is generated

respectively from the plurality of radiant burners, is discharged to the exhaust duct 12 which is positioned at the rear side of the outer case 10.

**[0031]** The outer case 10 is formed in a hexahedral shape with an upper side opened, an air inlet duct 11 to which air is flowed is formed on the front surface of the outer case 10, and an exhaust duct 12 is positioned on the rear surface of the hexahedron.

**[0032]** The ceramic glass 20 is formed to have an area which can cover the upper end of the outer case 10 and a predetermined thickness and the ceramic glass 20 is formed with materials through which radiant wave generated from the radiant burner 40 can penetrate.

**[0033]** On the upper surface of the ceramic glass 20, a cooking area A is printed so that a cooked material can be positioned at a position where the radiant wave which is generated from the radiant burner penetrates.

**[0034]** As shown in Figures 4 and 5, the first burner housing 300 includes a lower plate portion 310 in a rectangular shape which is formed to have a predetermined width and length, a side plate portion 320 which is formed bent and extended in the vertical direction corresponding to a contour of the lower plate portion 310 along the circumference on the side surface of the lower plate portion 310, a combining surface portion 330 formed extended and bent in parallel in the direction of the outer circumference from the end of the side plate portion 320 having a predetermined area, a plurality of mounting holes 340 which are penetrated and formed on both sides of the rectangular lower plate portion 310 so that the radiant burner 40 can be mounted and a plurality of exhaust through holes 350 which are formed corresponding to the mounting holes 340 in the center portion of the lower plate portion 310.

**[0035]** As the combining plate portion 330 is contacted and combined to a lower surface of the ceramic glass 20, the combining plate portion 330 forms an exhaust passage F for discharging combustion gas and convection heat together with the first burner housing 300, lower plate portion 310, side plate portion 320 and a lower surface of the ceramic glass 20.

**[0036]** Two or more mounting holes 340 are formed so that a large port having a predetermined diameter can be mounted.

**[0037]** On the other hand, the plurality of exhaust through holes 350 can be formed to face each other at the center portion of the first burner housing 300 correspondingly, and can be formed in a row to each other at the side portion of the first burner housing 300.

**[0038]** The shared exhaust duct 360 includes an exhaust stack 361 which is combined to be contacted on a side surface of the first burner housing and has a side surface in which a cut inflow hole 361 a is formed, so that exhaust gas, which is discharged from a plurality of exhaust through holes 350 which are formed on one side surface of the first burner housing 300, can be received, a partition 362 which is combined with the lower plate portion 310 of the first burner housing 300 in the direction

of a normal line, and respectively divides exhaust gas which is generated from a plurality of radiant burner formed on both sides of the burner housing 300 by dividing an exhaust passage Fa of the burner housing 300a of a side and exhaust passage Fb of the burner housing 300b of the other side and an exhaust cover 363 whose upper side is positioned to be contacted on the lower substrate of the ceramic glass 20 and whose lower side is combined to the partition 362, for preventing convection heat of the exhaust gas which is generated in the radiant burner 40 from being transferred to the ceramic glass 20.

**[0039]** The first burner housing 300 which is combined with the exhaust duct 360 is combined with a guide 370 which is bent corresponding to the shape and combined with the inner surface of the outer case 10.

**[0040]** The radiant burner 40 is fixed and combined so that a burner head 41 where a mixing room M is formed can be positioned in the mounting hole 340 of the first burner housing 300 and a mixing gas tube 44 is combined to a side surface of the burner head 41. A burner mat 42 which is a radiator for radiating a radiant wave is fixed and combined to the upper side of the burner head 41 so that the burner mat 42 can cover the mixing room M of the burner head 41 by heating the mixed gas as the gas in the mixing room M is discharged and combusted.

**[0041]** A ignition and inflammation detecting unit 43 for igniting the mixed gas which is outflowed through the burner mat 42 and detecting the combusting state of the gas, is combined to the lower plate portion 310 of the first burner housing 300 near from the burner mat 42.

**[0042]** Also, at the rear end portion of the mixing gas tube 44, gas supplying tube 48 and air supplying tube 49 are branched and connected, and a nozzle 60 is combined to an inner side of a position where the gas supplying tube 48 and air supplying tube 49 cross.

**[0043]** A fan housing 45 in which a blast fan 46 and fan motor 47 are mounted is combined to a rear end portion of the air supplying tube 49.

**[0044]** On the other hand, the gas radiation oven range can be composed of a plurality of assemblies which are combined with the first burner housing 300 and radiant burner 40 according to the usage and size.

**[0045]** As shown in Figures 3 and 6, the first embodiment of the gas radiation oven range in accordance with the present invention includes an outer case 10 which is formed to have an internal space with the upper side opened, ceramic glass 20 which is covered and combined with the upper end of the outer case 10, for placing foodstuffs therein, a first burner housing 300 which is combined and contacted with a lower surface of the ceramic glass 20, forms an exhaust passage F with the lower surface of the ceramic glass 20, and is integrally combined with a plurality of large ports in a dual structure, a second burner housing 400 in which respective medium port is formed at a side independently from the first burner housing 300 in which the plurality of large ports are formed, and third burner housing 500 in which a small

port is formed, a radiant burner 40 which is combined with a side surface of the respective burner housings 300, 400 and 500, for generating a radiant wave, combusting mixed gas and a shared discharge unit 360 which is positioned among large ports which are integrally formed in the respective first burner housings 300, combined to be connected to the respective exhaust passage F which are formed at the side portion of the large ports so that the exhaust gas, which is generated respectively from the plurality of radiant burners 40, is discharged to the exhaust duct 12 which is positioned at the rear side of the outer case 10.

[0046] In the first embodiment of the cooking system, the first burner housing 300 can be positioned at the front side of the product in which the inlet duct 11 of the outer case 10 is formed. Also, the second burner housing 400 and third burner housing 500 can be installed at the rear side of the product in which the exhaust duct 12 of the outer case 10 is formed, and vice versa.

[0047] As shown in Figure 6, the shared discharge unit 360 includes an exhaust stack 361 which is combined to be contacted on a side surface of the first burner housing 300 and has a side surface in which a cut inflow hole 361 a is formed, so that exhaust gas, which is discharged from a plurality of exhaust through holes 350 which are formed on one side surface of the first burner housing 300, can be received, a partition 362 which is combined with the lower plate portion 310 of the first burner housing 300 in the direction of a normal line, and respectively divides exhaust gas which is generated from a plurality of radiant burners formed on both sides of the first burner housing 300 by dividing an exhaust passage Fa of the burner housing 300a of a side and exhaust passage Fb of the burner housing 300b of the other side and an exhaust cover 363 whose upper side is positioned to be contacted on the lower substrate of the ceramic glass 20 and whose lower side is combined to the partition 362, for preventing convection heat of the exhaust gas which is generated in the radiant burner 40 from being transferred to the ceramic glass 20.

[0048] The exhaust stack 361 which is combined with the lower portion of the first burner housing 300 is extended and formed to the lower portion between the second burner housing 400 and third burner housing 500 and connected to the exhaust duct 12 which is formed at the rear surface of the outer case 10.

[0049] Also, exhaust ducts (not shown) which are respectively formed on the side surfaces of the second and third burner housings 400 and 500, are directly connected to the exhaust duct 12 which is formed on the rear surface of the outer case 10.

[0050] At the center portion of the lower plate portion 310 of the first burner housing 300, the plurality of exhaust through holes 350 which are formed corresponding to the mounting hole, are formed facing each other at the center portion of the first burner housing 300.

[0051] Hereinafter, a second embodiment of the cooking system of the gas radiation oven range in accordance

with the present invention will be described.

[0052] As shown in Figures 3 and 7, the second embodiment of the cooking system of the gas radiation oven range in accordance with the present invention includes an outer case 10 which is formed with an upper side opened, having an internal space, a ceramic glass 20 which is covered and combined with an upper end of the outer case 10 and in which cooked material is positioned, a first burner housing 300 which is combined and contacted with a lower surface of the ceramic glass 20, forms an exhaust passage F with the lower surface of the ceramic glass 20, and is integrally combined with a plurality of large ports in a dual structure, a fourth burner housing 600 in which a plurality of medium ports and small ports which are independent from the first burner housing 300 which is integrally formed with the plurality of large ports, a radiant burner 40 which is combined with a side surface of the respective burner housings 300 and 600, for generating a radiant wave, combusting mixed gas and a shared discharge unit 460 which is positioned among the plurality of burner housings 300 and 600 and combined to be connected to respective exhaust passages F which are formed at a side portion of the burner housings 300 and 600, for discharging exhaust gas which is generated from the plurality of radiant burners 40 respectively, to the exhaust duct 12 side which is positioned at the rear side of the outer case 10.

[0053] In the second embodiment of the cooking system, the first burner housing 300 can be positioned at the front side of the product in which the inlet duct 11 of the outer case 10 is formed. Also, the fourth burner housing 600 can be installed at the rear side of the product in which the exhaust duct 12 of the outer case 10 is formed, and vice versa.

[0054] As shown in Figure 7, the shared discharge unit 460 includes an exhaust stack 461 which is combined to be contacted on a side surface of the first burner housing 300 and fourth burner housing 600 and has a side surface in which cut inflow holes 461 a are formed, so that exhaust gas, which is discharged from a plurality of exhaust through holes 350 and 650 which are formed on one side surface of the first burner housing 300 and fourth burner housing 600, can be received, partitions 362 and 462 which are combined with the lower plate portions 310 and 610 of the first burner housing 300 and fourth burner housing 600 in the direction of a normal line, and respectively divides exhaust gas which is generated from a plurality of radiant burners 40 formed on both sides of the burner housing 300 and fourth burner housing 600 by dividing an exhaust passage Fa of the burner housings 300a and 600a of a side and exhaust passage Fb of the burner housings 300b and 600b of the other side, and exhaust cover 363 and 463 whose upper side is positioned to be contacted on the lower substrate of the ceramic glass 20 and whose lower side is combined to the partitions 362 and 462, for preventing convection heat of the exhaust gas which is generated in the radiant burner 40 from being transferred to the ceramic glass 20.

[0055] An exhaust stack 461 is combined with the lower portion of the first burner housing 300 and fourth burner housing 600 and shares the exhaust passage of the combustion gas and convection heat.

[0056] Also, on a side surface of the exhaust stack 461, a plurality of inflow grooves 461 a and 461 b are formed at the portion where the first burner housing 300 and fourth burner housing 600 are combined.

[0057] The exhaust stack 461 is connected to the exhaust duct 12 which is formed on the rear surface of the outer case 11.

[0058] The plurality of exhaust through holes 350 and 650 which are formed corresponding to the mounting holes 340 and 640, are formed to face each other at the center portions of the respective burner housings 300 and 600.

[0059] Hereinafter, a third embodiment of the cooking system of the gas radiation oven range in accordance with the present invention will be described.

[0060] As shown in Figures 3 and 8, the third embodiment of the cooking system of the gas radiation oven range in accordance with the present invention includes an outer case 10 which is formed with an upper side opened, having an internal space, a ceramic glass 20 which is covered and combined with an upper end of the outer case 10 and in which cooked material is positioned, a fifth burner housing 700 which is combined and contacted with a lower surface of the ceramic glass 20, forms an exhaust passage F with the lower surface of the ceramic glass 20, and is integrally combined with one or more large ports and one or more medium ports in a dual structure, a sixth burner housing 800 in which one or more large ports and one or more small ports which are positioned at the side portion independently from the fifth burner housing 700, are integrally formed, a radiant burner 40 which is combined with a side surface of the fifth burner housing 700 and sixth burner housing 800 respectively, for generating a radiant wave, combusting mixed gas and a shared discharge unit 560 which is positioned among the plurality of burner housings 700 and 800, and combined to be connected to respective exhaust passages Fa and Fb which are formed at a side portion of the burner housings 700 and 800, for discharging exhaust gas which is generated from the plurality of radiant burners 40 respectively, to the exhaust duct 12 side which is positioned at the rear side of the outer case 10.

[0061] In the third embodiment of the cooking system, the fifth burner housing 700 can be positioned at the right side to the front side of the product in which an inlet duct 11 of the outer case 10 is formed. The sixth burner housing 800 can be installed at the left side to the front side of the product in which the exhaust duct 12 of the outer case 10 is formed and vice versa.

[0062] As shown in Figure 8, the shared discharge unit 560 includes an exhaust stack 561 which is combined to be contacted on side surfaces of the fifth burner housing 700 and sixth burner housing 800 and has a side surface in which cut inflow holes 561 a and 561 b are formed, so

that exhaust gas, which is discharged from a plurality of exhaust through holes 750 and 850 which are formed on one side surface of the fifth burner housing 700 and sixth burner housing 800, can be received, a partition wall 562 which is combined to the inner portion of the exhaust stack 561, and respectively divides exhaust gas which is generated from a plurality of radiant burners 40 formed on both sides of the fifth burner housing 700 and sixth burner housing 800 by dividing exhaust passages Fa and Fb of the fifth burner housing 700 and exhaust passages Fa and Fb of the sixth burner housing 800, and first and second exhaust covers 563 and 564 which are combined with a center portion of the fifth burner housing 700 and sixth burner housing 800 with upper sides which are positioned to be contacted on the lower substrate of the ceramic glass 20, for dividing the exhaust passages Fa and Fb of the fifth burner housing 700 and sixth burner housing 800 and preventing convection heat of the exhaust gas which is generated in the radiant burner 40 from being transferred to the ceramic glass 20.

[0063] An exhaust stack 561 is combined to a lower portion of the fifth burner housing 700 and sixth burner housing 800 and shares exhaust passages of combustion gas and convection heat.

[0064] On the other hand, at the inner center portion of the exhaust stack 561, a partition wall 562 for dividing the passage is combined being extended from the upper portion to lower portion of the inner side surface.

[0065] Also, on the side surface of the exhaust stack 561, a plurality of inflow grooves 561 a and 561 b are formed in a portion where the fifth burner housing 700 is combined with the sixth burner housing 800.

[0066] The exhaust stack 561 is connected to the exhaust duct 12 which is formed on a rear surface of the outer case 11.

[0067] The plurality of exhaust through holes 750 and 850 which are formed corresponding to the mounting holes 740 and 840, are formed in a side portion of the respective burner housings 700 and 800 in parallel.

[0068] Hereinafter, the operation of the structure of the burner housing of such gas radiation oven range and cooking system for the same will be described as follows.

[0069] Firstly, when the gas radiation oven range is operated after putting a cooking vessel in which cooked material is contained in the cooking region of the ceramic glass 20, external air is sucked through the air inlet duct 11 by rotation of the blast fan 46. Then, the air is supplied to the mixing gas tube 44 through the fan housing 45 and at the same time, gas which is additionally supplied, is supplied to the mixing gas tube 44 and mixed with the air. The mixed gas is discharged through the burner mat 42 and ignited and simultaneously combusted by igniting flame which is generated in the ignition and inflammation detecting unit 43.

[0070] At this time, the mixed gas is discharged through the burner mat 42 and combusted simultaneously, and the burner mat 42 radiates radiant wave by heating the burner mat 42.

[0071] The radiant wave which is radiated in the burner mat 42 penetrates the ceramic glass 20 and heats the cooking vessel (not shown) to cook the foodstuffs.

[0072] The combustion gas and convection heat which are generated as the mixing gas is combusted, flow along through the exhaust passage F which is formed by the ceramic glass 20 and burner housings 300, 600, 700 and 800 at a predetermined flowrate and discharged to the outside of the gas radiation oven range through the exhaust duct 12 which is formed on the rear surface of the outer case 10 floating inside the exhaust stacks 361, 461 and 561 by passing the inflow grooves 361 a, 461 a, 461 b, 561 a and 561 b which are formed on a side surface of the exhaust passages 350, 650, 750 and 850 and exhaust stacks 361, 461 and 561 which are formed at the center portion of the lower plate portions 310, 610, 710 and 810 of the burner housing

[0073] Also, the combustion gas and convection heat which are generated from the respective burner housings are separated by the partitions 362 and 462 and partition wall 562 so that they are not mixed.

[0074] With the present invention, the gas radiation oven range can efficiently process the exhaust gas and prevent leakage of the gas by sharing the exhaust passage and having the corresponding structure of the burner housing.

[0075] Also, the apparatus of present invention is connected with a burner housing which is composed of an exhaust stack and two or more ports and accordingly the number of the component parts can be decreased and the assembling operation can become simpler.

[0076] Also, the present invention can satisfy property of the foodstuffs and demands of cooking industries for simultaneously cooking various foods.

[0077] At the present invention may be embodied in several forms without departing from the essential characteristics thereof, it should also be understood that the above-described embodiments are not limited by any of the details of the foregoing description, unless otherwise specified, but rather should be constructed within the scope as defined in the appended claims.

## Claims

### 1. A gas radiation oven range, comprising:

an outer case (10) whose upper side is open and which is formed to have a predetermined internal space;

a ceramic glass (20) which covers and is combined at the upper end of the outer case (10) and on which cooked material is positioned;

a first burner housing (300) which is in contact with the lower surface of the ceramic glass (20) to form an exhaust passage (F, Fa, Fb) together with the lower surface of the ceramic glass (20);

a plurality of radiant burners (40) which are com-

bined with one side surface of the first burner housing (300) for generating a radiant wave and for combusting mixed gas, each radiant burner (40) being connected to one respective exhaust passage (Fa, Fb) in a side portion of the first burner housing (300); and

a shared discharge unit (360) which is positioned between the plurality of radiant burners (40) and which extends from the exhaust passages (F, Fa, Fb) to the rear surface of the outer case (10), where the shared discharge unit (360) is connected to an exhaust duct (12) which is positioned at the rear side of the outer case (10) for discharging the exhaust gas generated respectively from the plurality of radiant burners (40).

### 2. The range of claim 1, wherein the burner housing (300) includes:

a lower plate portion (310) in a rectangular shape which is formed to have a predetermined width and length;

a side plate portion (320) which is formed bent and extended in the vertical direction corresponding to a contour of the lower plate portion (310) along the circumference on the side surface of the lower plate portion (310);

a combining surface portion (330) formed extended and bent in parallel in the direction of the outer circumference from the end of the side plate portion (320) having a predetermined area;

a plurality of mounting holes (340) which are penetrated and formed on both sides of the rectangular lower plate portion (310) so that the radiant burner (40) can be mounted; and

a plurality of exhaust through holes (350) which are formed corresponding to the mounting holes (340) in the center portion of the lower plate portion (310).

### 3. The range of claim 2, wherein the plurality of exhaust through holes (350) are formed correspondingly so that they face each other in the center portion of the burner housing (300).

### 4. The range of claim 2, wherein the plurality of exhaust through holes (350) are formed in parallel in a row in the side portion of the burner housing (300).

### 5. The range of claim 1, wherein the shared discharge unit (360) includes:

an exhaust stack (361) which is combined to be contacted on a side surface of the burner housing (300) and has a side surface in which a cut inflow hole (361a) is formed, so that exhaust gas, which is discharged from a plurality of ex-

- haust through holes (350) which are formed on one side surface of the burner housing (300), can be received;  
 a partition (362) which is combined with the lower plate portion (310) of the burner housing (300) in the direction of a normal line, and respectively divides exhaust gas which is generated from a plurality of radiant burners (40) formed on both sides of the burner housing (300a) by dividing an exhaust passage (Fa) of the burner housing (300a) of a side and exhaust passage (Fb) of the burner housing (300b) of the other side; and an exhaust cover (363) whose upper side is positioned to be contacted on the lower substrate of the ceramic glass (20) and whose lower side is combined to the partition, for preventing convection heat of the exhaust gas which is generated in the radiant burner (40) from being transferred to the ceramic glass (20).
6. The range of one of claims 1 to 5, wherein the radiant burners (40) of the first burner housing (300) have large ports which are integrally formed with the first burner housing (300), and wherein a second burner housing (400) with respective medium ports at a side independent from the first burner housing (300) and a third burner housing (500) with a small port are provided.
7. The range of claim 6, wherein the first burner housing (300) which is integrally combined with the plurality of large ports, is positioned on the front surface of the product in which an inlet duct (11) of the outer case (10) is formed and the second burner housing (400) in which the medium port is formed and the third burner housing (500) in which the small port is formed are positioned on the rear surface of the product on which the exhaust duct (12) of the outer case (10) is formed.
8. The range of claim 6, wherein the first burner housing (300) which is integrally combined with the plurality of large ports, is positioned on the rear surface of the product in which an exhaust duct (12) of the outer case (10) is formed and the second burner housing (400) in which the medium port is formed and the third burner housing (500) in which the small port is formed are positioned on the front surface of the product on which the inlet duct (11) of the outer case (10) is formed.
9. The range of claim 6, wherein the exhaust ducts of the second burner housing (400) and third burner housing (500) are directly connected to an exhaust duct (12) which is formed on the rear surface of the outer case (10).
10. The range of claim 6, wherein the exhaust stack (361) which is combined to the lower portion of the first burner housing (300) is formed extended at the lower portion between the second and third burner housings (400,500) and connected with the exhaust duct (12) which is formed at the rear portion of the outer case (10).
11. The range of claim 6, wherein a plurality of exhaust through holes (350) which are formed corresponding to the respective mounting holes (340) are formed correspondingly to face each other in the center portion of the first burner housing (300), in a center of the lower plate portion (310) of the first burner housing (300).
12. The range of one of claims 1 to 5, wherein the burners (40) of the first burner housing (300) have large ports which are integrally formed with the first burner housing (300), wherein a second burner housing (600) is provided which is integrally formed with a plurality of medium ports and small ports which are independent from the first burner housing (300), and wherein the shared discharge unit (460) is positioned between the plurality of burner housings (300,600).
13. The range of claim 12, wherein the first burner housing (300) which is integrally combined with the plurality of large ports, is positioned on the front surface of the product in which an inlet duct (11) of the outer case (10) is formed, and the second burner housing (600) in which the medium port and small ports are integrally formed is positioned on the rear surface of the product in which an exhaust duct (12) of the outer case (10) is formed.
14. The range of claim 12, wherein the first burner housing (300) which is integrally combined with the plurality of large ports, is positioned on the rear surface of the product in which an exhaust duct (12) of the outer case (10) is formed, and the second burner housing (600) in which the medium port and small ports are integrally formed is positioned on the front surface of the product in which an inlet duct (11) of the outer case (10) is formed.
15. The range of claim 12, wherein the first burner housing (300) and the second burner housing (600) share an exhaust stack (461) for discharging exhaust gas which is generated inside the housing.
16. The range of claim 15, wherein a plurality of inflow grooves (461a,461b) are formed on a side surface of the exhaust stack (461).
17. The range of claim 15, wherein the shared exhaust stack (461) is connected with the exhaust duct (12) which is formed on the rear surface of the outer case (10).

18. The range of claim 12, wherein the plurality of exhaust through holes (350,650) which are formed corresponding to the respective mounting holes (340,640) are formed correspondingly to face each other in the center portion of each burner housing (300,600), in the center of the lower plate portion (310,610) of each burner housing (300,600). 5
19. The range of claims 1 to 5, wherein the radiant burners (40) of the first burner housing (700) have one or more large ports and one or more medium ports, which first burner housing (700) is integrally combined with the ports, wherein a second burner housing (800) is provided which is integrally formed with one or more large ports and one or more small ports which are positioned at the side portion independent from the first burner housing (700), and wherein the shared discharge unit (560) is positioned between the first and second burner housing (700, 800). 10 15
20. The range of claim 19, wherein the first burner housing (700) which is integrally combined with one or more large ports and one or more medium ports, is positioned at the right side to the front surface of the product in which the inlet duct (11) of the outer case (10) is formed, and the second burner housing (800) in which one or more large ports and one or more small ports are integrally formed is positioned at the left side to the front surface of the product in which the inlet duct (11) of the outer case (10) is formed. 20 25 30
21. The range of claim 19, wherein the first burner housing (700) which is integrally combined with one or more large ports and one or more medium ports, is positioned at the left side to the front surface of the product in which the inlet duct (11) of the outer case (10) is formed, and the second burner housing (800) in which one or more large ports and one or more small ports are integrally formed, is positioned at the right side to the front surface of the product in which the inlet duct (11) of the outer case (10) is formed. 35 40
22. The range of claim 19, wherein the first burner housing (700) and second burner housing (800) share an exhaust stack (561) for discharging exhaust gas which is generated inside the housing. 45
23. The range of claim 19, wherein a plurality of inflow grooves (561a,561b) are formed on a side surface of the exhaust stack (561). 50
24. The range of claim 19, wherein the exhaust stack (561) for sharing is connected with the exhaust duct (12) which is formed on the rear surface of the outer case (10). 55
25. The range of claim 19, wherein the plurality of exhaust through holes (750,850) which are formed cor-

responding to respective mounting holes (740,840) at the side portion of the lower plate portion (710,810) of the respective burner housings (700,800), are formed in the side portion of the respective burner housings (700,800) in a row.

26. The range of claim 19, wherein the passage which is formed at the inner center portion of the exhaust stack (561) is divided by placing a partition (562) which is combined to be extended from the upper portion to the lower portion of the inner surface of the exhaust stack (561).
27. The range of one of claims 1 to 5, wherein a plurality of burner housings (300,...800) are provided which are combined to be contacted with a lower surface of the ceramic glass (20) to form an exhaust passage (F,Fa,Fb) with the lower surface of the ceramic glass (20), wherein the plurality of burner housings (300,...800) is integrally combined with the plurality of ports with different sizes, and wherein the shared discharge unit (360) is positioned between the plurality of burner housings (300,...800).

#### Patentansprüche

##### 1. Strahlungsgasherd, enthaltend:

ein äußeres Gehäuse (10), dessen obere Seite offen ist und das so ausgebildet ist, dass es einen vorbestimmten Innenraum hat;  
 ein Keramikglas (20), das das obere Ende des äußeren Gehäuses (10) abdeckt und mit diesem kombiniert ist und auf dem Kochgut positioniert wird;  
 ein erstes Brennergehäuse (300), das mit der unteren Oberfläche des Keramikglases (20) in Kontakt ist und zusammen mit der unteren Oberfläche des Keramikglases (20) einen Abgaskanal (F, Fa, Fb) bildet;  
 eine Vielzahl von Strahlungsbrennern (40), die mit einer Seitenfläche des ersten Brennergehäuses (300) kombiniert sind, zur Erzeugung einer Strahlungswelle und zur Verbrennung von Mischgas, wobei jeder Strahlungsbrenner (40) mit jeweils einem Abgaskanal (Fa, Fb) in einem Seitenabschnitt des ersten Brennergehäuses (300) verbunden ist; und  
 eine gemeinsame Abzugseinheit (360), die zwischen der Vielzahl von Strahlungsbrennern (40) angeordnet ist und die von den Abgaskanälen (F, Fa, Fb) zu der hinteren Oberfläche des äußeren Gehäuses (10) verläuft, wo die gemeinsame Abzugseinheit (360) mit einer Abgasleitung (12) verbunden ist, die an der Rückseite des äußeren Gehäuses (10) angeordnet ist, um das jeweils von der Vielzahl von Strahlungs-

brennern (40) erzeugte Abgas abzuleiten.

2. Herd nach Anspruch 1, bei welchem das Brennergehäuse (300) umfasst:

einen unteren Plattenabschnitt (310) in rechteckiger Form, der so ausgebildet ist, dass er eine vorbestimmte Breite und Länge hat;  
einen Seitenplattenabschnitt (320), der einem Umriss des unteren Plattenabschnitts (310) entsprechend entlang dem Umfang an der Seitenfläche des unteren Plattenabschnitts (310) in vertikaler Richtung umgebogen und fortgeführt gebildet ist;

einen Verbindungsflächenabschnitt (330), der von dem Ende des Seitenplattenabschnitts (320) fortgeführt und parallel in Richtung des äußeren Umfangs umgebogen gebildet ist und eine vorbestimmte Fläche hat;

eine Vielzahl von Montagelöchern (340), die an beiden Seiten des rechteckigen unteren Plattenabschnitts (310) durchgebohrt und so gebildet sind, dass der Strahlungsbrenner (40) montiert werden kann; und

eine Vielzahl von Abgas-Durchgangslöchern (350), die den Montagelöchern (340) entsprechend in dem Mittelabschnitt des unteren Plattenabschnitts (310) gebildet sind.

3. Herd nach Anspruch 2, bei welchem die Vielzahl von Abgas-Durchgangslöchern (350) korrespondierend gebildet ist, so dass sie im Mittelabschnitt des Brennergehäuses (300) einander gegenüberliegen.

4. Herd nach Anspruch 2, bei welchem die Vielzahl von Abgas-Durchgangslöchern (350) parallel in einer Reihe in dem Seitenabschnitt des Brennergehäuses (300) gebildet ist.

5. Herd nach Anspruch 1, bei welchem die gemeinsame Abzugseinheit (360) umfasst:

einen Abgaskamin (361), der so verbunden ist, dass er an einer Seitenfläche des Brennergehäuses (300) in Kontakt gebracht wird und eine Seitenfläche hat, in der eine geschnittene Einströmöffnung (361a) gebildet ist, so dass Abgas, das von einer Vielzahl von Abgas-Durchgangslöchern (350) ausgestoßen wird, die an einer Seitenfläche des Brennergehäuses (300) gebildet sind, aufgenommen werden kann;

eine Trennwand (362), die mit dem unteren Plattenabschnitt (310) des Brennergehäuses (300) in der Richtung einer Normallinie verbunden ist und jeweils Abgas, das von einer Vielzahl von Strahlungsbrennern (40) erzeugt wird, die auf beiden Seiten des Brennergehäuses (300a) gebildet sind, unterteilt, indem ein Abgaskanal (Fa)

des Brennergehäuses (300a) an einer Seite und ein Abgaskanal (Fb) des Brennergehäuses (300b) an der anderen Seite abgeteilt werden; und

eine Abgasabdeckung (363), deren Oberseite so positioniert ist, dass sie mit dem unteren Substrat des Keramikglases (20) in Kontakt gebracht wird und dessen Unterseite mit der Trennwand verbunden ist, um zu verhindern, dass Konvektionswärme des Abgases, das in dem Strahlungsbrenner (40) erzeugt wird, auf das Keramikglas (20) übertragen wird.

6. Herd nach einem der Ansprüche 1 bis 5, bei welchem die Strahlungsbrenner (40) des ersten Brennergehäuses (300) große Öffnungen haben, die einstückig mit dem ersten Brennergehäuse (300) gebildet sind, und bei welchem ein zweites Brennergehäuse (400) mit jeweiligen mittleren Öffnungen an einer Seite unabhängig von dem ersten Brennergehäuse (300) und ein drittes Brennergehäuse (500) mit einer kleinen Öffnung vorgesehen sind.

7. Herd nach Anspruch 6, bei welchem das erste Brennergehäuse (300), das einstückig mit der Vielzahl von großen Öffnungen verbunden ist, an der Vorderfläche des Produkts positioniert ist, in der eine Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist, und das zweite Brennergehäuse (400), in dem die mittlere Öffnung gebildet ist, und das dritte Brennergehäuse (500), in dem die kleine Öffnung gebildet ist, an der rückwärtigen Fläche des Produkts positioniert sind, an der die Abgasleitung (12) des äußeren Gehäuses (10) gebildet ist.

8. Herd nach Anspruch 6, bei welchem das erste Brennergehäuse (300), das einstückig mit der Vielzahl von großen Öffnungen verbunden ist, an der rückwärtigen Fläche des Produkts positioniert ist, in der eine Abgasleitung (12) des äußeren Gehäuses (10) gebildet ist, und das zweite Brennergehäuse (400), in dem die mittlere Öffnung gebildet ist, und das dritte Brennergehäuse (500), in dem die kleine Öffnung gebildet ist, an der Vorderfläche des Produkts positioniert sind, an welcher die Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist.

9. Herd nach Anspruch 6, bei welchem die Abgasleitungen des zweiten Brennergehäuses (400) und des dritten Brennergehäuses (500) direkt mit einer Abgasleitung (12) verbunden sind, die an der rückwärtigen Fläche des äußeren Gehäuses (10) gebildet ist.

10. Herd nach Anspruch 6, bei welchem der Abgaskamin (361), der mit dem unteren Abschnitt des ersten Brennergehäuses (300) verbunden ist, an dem unteren Abschnitt zwischen dem zweiten und dem drit-

ten Brennergehäuse (400, 500) verlängert gebildet ist und mit der Abgasleitung (12) verbunden ist, die an dem rückwärtigen Abschnitt des äußeren Gehäuses (10) gebildet ist.

11. Herd nach Anspruch 6, bei welchem die Vielzahl von Abgas-Durchgangslöchern (350), die den jeweiligen Montagelöchern (340) entsprechend gebildet sind, korrespondierend so gebildet ist, dass sie einander in dem Mittelabschnitt des ersten Brennergehäuses (300) in der Mitte des unteren Plattenabschnitts (310) des ersten Brennergehäuses (300) gegenüberliegen.

12. Herd nach einem der Ansprüche 1 bis 5, bei welchem die Brenner (40) des ersten Brennergehäuses (300) große Öffnungen haben, die einstückig mit dem ersten Brennergehäuse (300) gebildet sind, bei welchem ein zweites Brennergehäuse (600) vorgesehen ist, das mit einer Vielzahl von mittleren Öffnungen und kleinen Öffnungen einstückig gebildet ist, die von dem ersten Brennergehäuse (300) unabhängig sind, und bei welchem die gemeinsame Abzugseinheit (460) zwischen der Vielzahl von Brennergehäusen (300, 600) positioniert ist.

13. Herd nach Anspruch 12, bei welchem das erste Brennergehäuse (300), das mit der Vielzahl von großen Öffnungen einstückig verbunden ist, an der Vorderfläche des Produkts positioniert ist, in der eine Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist, und das zweite Brennergehäuse (600), in welchem die mittlere Öffnung und kleine Öffnungen einstückig gebildet sind, an der rückwärtigen Fläche des Produkts positioniert ist, in der eine Abgasleitung (12) des äußeren Gehäuses (10) gebildet ist.

14. Herd nach Anspruch 12, bei welchem das erste Brennergehäuse (300), das mit der Vielzahl von großen Öffnungen einstückig verbunden ist, an der rückwärtigen Fläche des Produkts positioniert ist, in der eine Abgasleitung (12) des äußeren Gehäuses (10) gebildet ist, und das zweite Brennergehäuse (600), in welchem die mittlere Öffnung und kleine Öffnungen einstückig gebildet sind, an der Vorderfläche des Produkts positioniert ist, in der eine Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist.

15. Herd nach Anspruch 12, bei welchem das erste Brennergehäuse (300) und das zweite Brennergehäuse (600) einen Abgaskamin (461) für den Ausstoß von Abgas, das innerhalb des Gehäuses erzeugt wird, gemeinsam nutzen.

16. Herd nach Anspruch 15, bei welchem eine Vielzahl von Einströmnuten (461a, 461b) an einer Seitenfläche des Abgaskamins (461) gebildet ist.

17. Herd nach Anspruch 15, bei welchem der gemeinsame Abgaskamin (461) mit der Abgasleitung (12) verbunden ist, die an der rückwärtigen Fläche des äußeren Gehäuses (10) gebildet ist.

18. Herd nach Anspruch 12, bei welchem die Vielzahl von Abgas-Durchgangslöchern (350, 650), die den jeweiligen Montagelöchern (340, 640) entsprechend gebildet sind, korrespondierend so gebildet sind, dass sie einander in dem Mittelabschnitt jedes Brennergehäuses (300, 600) in der Mitte des unteren Plattenabschnitts (310, 610) jedes Brennergehäuses (300, 600) gegenüberliegen.

19. Herd nach Anspruch 1 bis 5, bei welchem die Strahlungsbrenner (40) des ersten Brennergehäuses (700) eine oder mehrere große Öffnungen und eine oder mehrere mittlere Öffnungen haben, welches erste Brennergehäuse (700) einstückig mit den Öffnungen verbunden ist, bei welchem ein zweites Brennergehäuse (800) vorgesehen ist, das einstückig mit einer oder mehreren großen Öffnungen und einer oder mehreren kleinen Öffnungen gebildet ist, die an dem Seitenabschnitt unabhängig von dem ersten Brennergehäuse (700) positioniert sind, und bei welchem die gemeinsame Abzugseinheit (560) zwischen dem ersten und dem zweiten Brennergehäuse (700, 800) positioniert ist.

20. Herd nach Anspruch 19, bei welchem das erste Brennergehäuse (700), das mit einer oder mehreren großen Öffnungen und einer oder mehreren mittleren Öffnungen einstückig verbunden ist, an der rechten Seite zu der Vorderfläche des Produkts positioniert ist, in welcher die Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist, und das zweite Brennergehäuse (800), in welchem eine oder mehrere große Öffnungen und eine oder mehrere kleine Öffnungen einstückig gebildet sind, an der linken Seite zu der Vorderfläche des Produkts positioniert ist, in der die Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist.

21. Herd nach Anspruch 19, bei welchem das erste Brennergehäuse (700), das mit einer oder mehreren großen Öffnungen und einer oder mehreren mittleren Öffnungen einstückig verbunden ist, an der linken Seite zu der Vorderfläche des Produkts positioniert ist, in welcher die Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist, und das zweite Brennergehäuse (800), in welchem eine oder mehrere große Öffnungen und eine oder mehrere kleine Öffnungen einstückig gebildet sind, an der rechten Seite zu der Vorderfläche des Produkts positioniert ist, in der die Einlaßleitung (11) des äußeren Gehäuses (10) gebildet ist.

22. Herd nach Anspruch 19, bei welchem das erste

Brennergehäuse (700) und das zweite Brennergehäuse (800) einen Abgaskamin (561) für den Ausstoß von Abgas gemeinsam nutzen, das innerhalb des Gehäuses erzeugt wird.

23. Herd nach Anspruch 19, bei welchem eine Vielzahl von Einströmnuten (561a, 561b) an einer Seitenfläche des Abgaskamins (561) gebildet ist.

24. Herd nach Anspruch 19, bei welchem der Abgaskamin (561) zur gemeinsamen Nutzung mit der Abgasleitung (12) verbunden ist, die an der rückwärtigen Fläche des äußeren Gehäuses (10) gebildet ist.

25. Herd nach Anspruch 19, bei welchem die Vielzahl von Abgas-Durchgangslöchern (750, 850), die den jeweiligen Montagelöchern (740, 840) entsprechend an dem Seitenabschnitt des unteren Plattenabschnitts (710, 810) der jeweiligen Brennergehäuse (700, 800) gebildet sind, in dem Seitenabschnitt der jeweiligen Brennergehäuse (700, 800) in einer Reihe gebildet sind.

26. Herd nach Anspruch 19, bei welchem der Kanal, der an dem inneren Mittelabschnitt des Abgaskamins (561) gebildet ist, unterteilt ist, indem eine Trennwand (562), die so verbunden ist, dass sie sich von dem oberen Abschnitt zu dem unteren Abschnitt der inneren Oberfläche des Abgaskamins (561) erstreckt, angeordnet ist.

27. Herd nach einem der Ansprüche 1 bis 5, bei welchem eine Vielzahl von Brennergehäusen (300, ..., 800) vorgesehen sind, die so verbunden sind, dass sie mit einer unteren Oberfläche des Keramikglases (20) in Kontakt stehen, so dass sie einen Abgaskanal (F, Fa, Fb) mit der unteren Oberfläche des Keramikglases (20) bilden, wobei die Vielzahl der Brennergehäuse (300, ..., 800) mit der Vielzahl von Öffnungen mit verschiedenen Größen einstückig verbunden ist und wobei die gemeinsam genutzte Abzugseinheit (360) zwischen der Vielzahl der Brennergehäuse (300, ..., 800) positioniert ist.

## Revendications

1. Cuisinière à rayonnement gazeux, comprenant :

- un coffre externe (10) dont le côté supérieur est ouvert et qui est formé de façon à présenter un espace interne prédéterminé ;
- un verre céramique (20) qui recouvre et est combiné au niveau de l'extrémité supérieure du coffre externe (10) et sur lequel du matériau cuisiné est positionné ;
- un premier logement de brûleur (300) qui est en contact avec la surface inférieure du verre cé-

ramique (20) pour former un passage d'échappement (F, Fa, Fb) conjointement avec la surface inférieure du verre céramique (20) ;  
une pluralité de brûleurs à rayonnement (40) qui sont combinés avec une surface latérale du premier logement de brûleur (300) pour générer une onde radiante et pour brûler du gaz mélangé, chaque brûleur à rayonnement (40) étant raccordé à un passage d'échappement respectif (Fa, Fb) dans une partie latérale du premier logement de brûleur (300) ; et  
une unité d'évacuation partagée (360) qui est positionnée entre la pluralité de brûleurs à rayonnement (40) et qui s'étend depuis les passages d'échappement (F, Fa, Fb) vers la surface arrière du coffre externe (10), où l'unité d'évacuation partagée (360) est raccordée à un conduit d'échappement (12) qui est positionné au niveau du côté arrière du coffre externe (10) pour évacuer le gaz d'échappement respectivement généré par la pluralité de brûleurs à rayonnement (40).

2. Cuisinière selon la revendication 1, dans laquelle le logement de brûleur (300) comprend :

- une partie de plaque inférieure (310) de forme rectangulaire qui est formée de façon à présenter une largeur et une longueur prédéterminées ;
- une partie de plaque latérale (320) qui est formée courbée et étendue dans la direction verticale correspondant à un contour de la partie de plaque inférieure (310) le long de la circonférence de la surface latérale de la partie de plaque inférieure (310) ;
- une partie de surface de combinaison (330) formée étendue et courbée en parallèle dans la direction de la circonférence externe depuis l'extrémité de la partie de plaque latérale (320) ayant une aire prédéterminée ;
- une pluralité de trous de montage (340) qui sont formés et qui pénètrent sur les deux côtés de la partie de plaque inférieure rectangulaire (310) de façon que le brûleur à rayonnement (40) puisse être monté ; et
- une pluralité d'orifices traversants d'échappement (350) qui sont formés pour correspondre aux trous de montage (340) dans la partie centrale de la partie de plaque inférieure (310).

3. Cuisinière selon la revendication 2, dans laquelle la pluralité d'orifices traversants d'échappement (350) sont formés de façon correspondante de manière à se faire face les uns les autres dans la partie centrale du logement de brûleur (300).

4. Cuisinière selon la revendication 2, dans laquelle la

pluralité d'orifices traversants d'échappement (350) sont formés en parallèle dans une rangée dans la partie latérale du logement de brûleur (300).

5. Cuisinière selon la revendication 1, dans laquelle l'unité d'évacuation partagée (360) comprend :

une cheminée d'échappement (361) qui est combinée pour entrer en contact avec une surface latérale du logement de brûleur (300) et possède une surface latérale dans laquelle un orifice d'amenée découpé (361a) est formé, de façon que le gaz d'échappement, qui est évacué depuis une pluralité d'orifices traversants d'échappement (350) qui sont formés sur une surface latérale du logement de brûleur (300), puisse être reçu ;

une paroi de séparation (362) qui est combinée avec la partie de plaque inférieure (310) du logement de brûleur (300) dans la direction d'une ligne normale, et divise respectivement le gaz d'échappement qui est généré par une pluralité de brûleurs à rayonnement (40) formés sur les deux côtés du logement de brûleur (300a) en divisant un passage d'échappement (Fa) du logement de brûleur (300a) sur un côté et un passage d'échappement (Fb) du logement de brûleur (300b) sur l'autre côté ; et

un couvercle d'échappement (363) dont le côté supérieur est positionné de façon à entrer en contact sur le substrat inférieur du verre céramique (20) et dont le côté inférieur est combiné à la paroi de séparation, pour empêcher de transférer la chaleur de convection du gaz d'échappement qui est générée dans le brûleur à rayonnement (40) au verre céramique (20).

6. Cuisinière selon l'une des revendications 1 à 5, dans laquelle les brûleurs à rayonnement (40) du premier logement de brûleur (300) possèdent de grands orifices qui sont intégralement formés avec le premier logement de brûleur (300), et dans laquelle un deuxième logement de brûleur (400) ayant des orifices moyens respectifs sur un côté indépendant du premier logement de brûleur (300) et un troisième logement de brûleur (500) ayant un petit orifice, sont prévus.

7. Cuisinière selon la revendication 6, dans laquelle le premier logement de brûleur (300) qui est intégralement combiné avec la pluralité de grands orifices est positionné sur la surface avant du produit dans lequel un conduit d'entrée (11) du coffre externe (10) est formé et le deuxième logement de brûleur (400) dans lequel l'orifice moyen est formé et le troisième logement de brûleur (500) dans lequel le petit orifice est formé sont positionnés sur la surface arrière du produit sur lequel le conduit d'échappement (12) du

coffre externe (10) est formé.

8. Cuisinière selon la revendication 6, dans laquelle le premier logement de brûleur (300) qui est intégralement combiné avec la pluralité de grands orifices, est positionné sur la surface arrière du produit dans lequel un conduit d'échappement (12) du coffre externe (10) est formé et le deuxième logement de brûleur (400) dans lequel l'orifice moyen est formé et le troisième logement de brûleur (500) dans lequel le petit orifice est formé sont positionnés sur la surface avant du produit sur lequel le conduit d'entrée (11) du coffre externe (10) est formé.

9. Cuisinière selon la revendication 6, dans laquelle les conduits d'échappement du deuxième logement de brûleur (400) et du troisième logement de brûleur (500) sont directement raccordés à un conduit d'échappement (12) qui est formé sur la surface arrière du coffre externe (10).

10. Cuisinière selon la revendication 6, dans laquelle la cheminée d'échappement (361) qui est combinée à la partie inférieure du premier logement de brûleur (300) est formée de façon étendue au niveau de la partie inférieure entre les deuxième et troisième logements de brûleur (400, 500) et raccordée au conduit d'échappement (12) qui est formé sur la partie arrière du coffre externe (10).

11. Cuisinière selon la revendication 6, dans laquelle une pluralité d'orifices traversants d'échappement (350) qui sont formés de façon à correspondre aux orifices de montage respectifs (340), sont formés de façon correspondante les uns en face des autres dans la partie centrale du premier logement de brûleur (300), au centre de la partie de plaque inférieure (310) du premier logement de brûleur (300).

12. Cuisinière selon l'une quelconque des revendications 1 à 5, dans laquelle les brûleurs (40) du premier logement de brûleur (300) possèdent de grands orifices qui sont intégralement formés avec le premier logement de brûleur (300), dans laquelle un deuxième logement de brûleur (600) est prévu, intégralement formé avec une pluralité d'orifices moyens et de petits orifices qui sont indépendants du premier logement de brûleur (300), et dans laquelle l'unité d'évacuation partagée (460) est positionnée entre la pluralité de logements de brûleurs (300, 600).

13. Cuisinière selon la revendication 12, dans laquelle le premier logement de brûleur (300), qui est intégralement combiné avec la pluralité de grands orifices, est positionné sur la surface avant du produit dans lequel un conduit d'entrée (11) du coffre externe (10) est formé, et le deuxième logement de brûleur (600) dans lequel les orifices moyens et les petits

orifices sont intégralement formés est positionné sur la surface arrière du produit dans lequel un conduit d'échappement (12) du coffre externe (10) est formé.

14. Cuisinière selon la revendication 12, dans laquelle le premier logement de brûleur (300), qui est intégralement combiné avec la pluralité de grands orifices, est positionné sur la surface arrière du produit dans lequel un conduit d'échappement (12) du coffre externe (10) est formé, et le deuxième logement de brûleur (600) dans lequel les orifices moyens et les petits orifices sont intégralement formés est positionné sur la surface avant du produit dans lequel un conduit d'entrée (11) du coffre externe (10) est formé. 5 10
15. Cuisinière selon la revendication 12, dans laquelle le premier logement de brûleur (300) et le deuxième logement de brûleur (600) partagent une cheminée d'échappement (461) destinée à évacuer le gaz d'échappement qui est généré à l'intérieur du logement. 20
16. Cuisinière selon la revendication 15, dans laquelle une pluralité de rainures d'amenée (461a, 461b) sont formées sur une surface latérale de la cheminée d'échappement (461). 25
17. Cuisinière selon la revendication 15, dans laquelle la cheminée d'échappement partagée (461) est raccordée au conduit d'échappement (12) qui est formé sur la surface arrière du coffre externe (10). 30
18. Cuisinière selon la revendication 12, dans laquelle la pluralité d'orifices traversants d'échappement (350, 650) qui sont formés de façon à correspondre aux orifices de montage respectifs (340, 640) sont formés de façon correspondante les uns en face des autres dans la partie centrale de chaque logement de brûleur (300, 600) au centre de la partie de plaque inférieure (310, 610) de chaque logement de brûleur (300, 600). 35 40
19. Cuisinière selon l'une quelconque des revendications 1 à 5, dans laquelle les brûleurs à rayonnement (40) du premier logement de brûleur (700) possèdent un ou plusieurs grands orifices et un ou plusieurs orifices moyens, lequel premier logement de brûleur (700) est intégralement combiné aux orifices, dans laquelle un deuxième logement de brûleur (800) est prévu, formé intégralement avec un ou plusieurs grands orifices et un ou plusieurs petits orifices qui sont positionnés sur la partie latérale indépendante du premier logement de brûleur (700), et dans laquelle l'unité d'évacuation partagée (560) est positionnée entre les premier et deuxième logements de brûleur (700, 800). 45 50 55

20. Cuisinière selon la revendication 19, dans laquelle le premier logement de brûleur (700), qui est intégralement combiné avec un ou plusieurs grands orifices et un ou plusieurs orifices moyens, est positionné sur le côté droit sur la surface avant du produit dans lequel le conduit d'entrée (11) du coffre externe (10) est formé, et le deuxième logement de brûleur (800), dans lequel un ou plusieurs grands orifices et un ou plusieurs petits orifices sont intégralement formés est positionné sur le côté gauche de la surface avant du produit dans lequel le conduit d'entrée (11) du coffre externe (10) est formé.
21. Cuisinière selon la revendication 19, dans laquelle le premier logement de brûleur (700), qui est intégralement combiné avec un ou plusieurs grands orifices et un ou plusieurs orifices moyens, est positionné sur le côté gauche de la surface avant du produit dans lequel le conduit d'entrée (11) du coffre externe (10) est formé, et le deuxième logement de brûleur (800), dans lequel un ou plusieurs grands orifices et un ou plusieurs petits orifices sont intégralement formés est positionné sur le côté droit de la surface avant du produit dans lequel le conduit d'entrée (11) du coffre externe (10) est formé.
22. Cuisinière selon la revendication 19, dans laquelle le premier logement de brûleur (700) et le deuxième logement de brûleur (800) partagent une cheminée d'échappement (561) destinée à évacuer le gaz d'échappement qui est généré à l'intérieur du logement.
23. Cuisinière selon la revendication 19, dans laquelle une pluralité de rainures d'amenée (561a, 561b) sont formées sur une surface latérale de la cheminée d'échappement (561).
24. Cuisinière selon la revendication 19, dans laquelle la cheminée d'échappement (561) à partager est raccordée au conduit d'échappement (12) qui est formé sur la surface arrière du coffre externe (10).
25. Cuisinière selon la revendication 19, dans laquelle la pluralité d'orifices traversants d'échappement (750, 850) qui sont formés de façon à correspondre aux trous de montage respectifs (740, 840) au niveau de la partie latérale de la partie de plaque inférieure (710, 810) des logements de brûleur respectifs (700, 800), sont formés sur la partie latérale des logements de brûleur respectifs (700, 800) en rangée.
26. Cuisinière selon la revendication 19, dans laquelle le passage qui est formé au niveau de la partie centrale interne de la cheminée d'échappement (561) est divisé en plaçant une paroi de séparation (562) qui est combinée de façon à s'étendre depuis la par-

tie supérieure jusqu'à la partie inférieure de la surface interne de la cheminée d'échappement (561).

27. Cuisinière selon l'une quelconque des revendications 1 à 5, dans laquelle une pluralité de logements de brûleur (300, ..., 800) sont prévus, lesquels sont combinés de façon à être en contact avec une surface inférieure du verre céramique (20) pour former un passage d'échappement (F, Fa, Fb) avec la surface inférieure du verre céramique (20), dans laquelle la pluralité de logements de brûleurs (300, ..., 800) est intégralement combinée avec la pluralité d'orifices de différentes tailles, et dans laquelle l'unité d'évacuation partagée (360) est positionnée entre la pluralité de logements de brûleurs (300, ..., 800).
